against other antiapoptotic genes. The present sequence represents a mismatch control oigonucleotide, used in antisense assays of antiapoptotic protein TRPM-2 (testosterone-repressed prostate message-2)

```
gene
```

The invention comprises antisense oligonucleotides that are capable of inhibiting expression of the human clusterin gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of clusterin in cells. The antisense oligonucleotides are also useful for treating an animal with a disease or condition associated with hyperpoliferative disorders; and hyperplaining, and phyerilpidemic disorders. The present DNA sequence represents a PCR primer used to amplify the human clusterin Example 13; Page 80; 125pp; English

New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.

Example 13; Page 20; 44pp; English

The invention relates to a compound consisting of an oligonucleotide with a phosphorothioate backbone throughout, in which: (a) sugars on nucleotide readidues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-dexy; and (b) the cytosines at constitue in a used: (a) to delay progression of androgen-sensitive prostatic cancer cells to the androgen-since that in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing control control and some breast cancer cells) that express abnormal levels of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, covarian and some breast cancer cells) that express abnormal levels of concernation and some breast cancer cells) that express abnormal levels of concernation and some breast cancer cells) that express abnormal levels of concernation and some breast cancer cells) that express abnormal levels of concernation and some breast cancer cells) that concernations present in (I) in crease stability in vivo and activity (both in vivo or in vitro) and created in a symergistic increase in effect when (I) is used with chemotherapeutic agents or other antisense oligonucleotides directed

The invention is useful for enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is control testosterone-repressed prostate message-2 (TRPM-2) mismatch oligonucleotide. The oligonucleotide is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.

AAT41542 and AAT41543 are J1 allele-specific primer/probes used as controls in an example of a method for detecting polymorphisms associated with an allelic variation in the human apolipoprotein-J (ApoJ) gene. The oligonucleotide (OG) detects the probability of a person developing hizheimer's disease (AD), preferably in patients of African or Hispanic descent. The OG also detects the probability of a person developing a cognitive disorder, or a prostatic carcinoma. Transgenic mammals expressing an allelic variant of an ApoJ gene may be used as a prognostic and diagnostic means for studying AD, and to determine the effectiveness of therapeutic drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic, virucide, neuroprotective, nootropic, neuroleptic, gene chip, antisense, sense; tumour, cell degeneration, cancer, Alzheimer's disease; schizophrenia, protein chip, gene therapy; tumour suppression; human fukutin, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAT41526 is a primer/probe used to detect a J3 allelic variation in the human apolipoprotein-J (ApoJ) gene. The primer/probe is used for detecting polymorphisms associated with an allelic variation in the ApoJ gene. The oligonucleotide (OG) detects the probability of a person developing Alzheimer's disease (AD), preferably in patients of African or Hispanic descent. The OG also detects the probability of a person developing a cognitive disorder, or a prostatic carcinoma. Transgenic mammals expressing an allelic variant of an ApoJ gene may be used as a prognostic and diagnostic means for studying AD, and to determine the
                                                                                                                                                                                                                                  Apolipoprotein J; ApoJ; polymorphism; detection; allele; exon; probe; primer; specific; Alzheimer's disease; polymerase chain reaction; PCR; diagnosis; ss.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment at least 80 % identity to the 17 mer sequence that obtained to the ment at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of agene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the mucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and contained the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips the polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression crafted human fukutin oligomucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic, antiviral; neuroprotective; nootropic; neuroleptic; ss;

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the curleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour correspondinant polypeptides, and to prepare transgenic acids, as in vitro suppression or reversion, apoptosis and or viral resistance, to produce cecominant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (calls containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease can be used for diagnosis and/or prognosis of these diseases. The nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides can be used for diagnosis of potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                          New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus; HCV; non-A, non-B hepatitis virus; NANBHV; antisense oligonuclectide; translation inhibition; therapy; 5'-UTR; 5'-untranslated region; loop C; 8s.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

HCV types 2, 3, 4, 5 or 6 and subtypes 1a, 1b, 2a, 2b, 3a, 3b, 3c, 4a, 4b, 4c, 4d, 4e, 4f, 4g and 4h can be typed. Antisense probe 155 was used in the identification of type 4 isolates. (Updated on 25-MAR-2003 to correct
is important for protection against an aerosol challenge of WEE used in biological warfare. The prophylactic method of the invention is used for inducing a protective immune response to eastern equine encephalitis virus and Venezuelan equine encephalitis virus in a mammal. The present sequence represents a WEE virus 26S region PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel mammalian expression vector, under which expression of the structural genes of western equine encephalitis (WEE) virus strain 71V-1658 have been placed under the control of a eukaryotic promoter. The expression vector has anti-encephalitis activity. The invention provides a means of developing a vaccine to the WEE virus which
                                                                                                                                                                                                        Antisense oligonucleotides were synthesised which are complementary to target sequences located at 10-nucleotide intervals from nucleotide 1 to 239 in the HCV RNA 5'-unitanslated region. Of these sequences (GAS-1 to CAS-320), oligonucleotide CAS-110 (AASG-8403), which is complementary to a portion of loop C, was found to cause greater than 80% inhibition of core protein translation. The nucleotide at position 119 in loop C has a high variation rate among HCV strains so oligonucleotide CAS-110-1-119 was synthesised in which inosine replaced the T (corresp. to A at position 119) in CAS-110. The CAS-110-1-119 showed an inhibitory activity of more than 70%. A control oligonucleotide (CAS-110-6-119) showed much lower activity. See AAQSB-888-QSB-AQ44885-Q44892 and AAQSB-883. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                Anti:sense oligo:nucleotide(s) complementary to hepatitis C viral genome - useful for inhibiting HCV replication, to treat related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; expression vector; western equine encephalitis; WEE; anti-encephalitis; virus; encephalitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A western equine encephalitis (WEE) virus strain used to develop DNA vaccines to WEE virus and related alphaviruses.

                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Duchenne muscular dystrophy gene-specific antisense oligonucleotide #7.

The invention comprises a method for generating an oligonucleotide involving: determining from a secondary structure of RNA from an exon, a region that assumes a structure that is hybridised to another part of the region that assumes a structure that is not hybridised in the RNA (closed structure) and subsequently generating an structure (open structure), and subsequently generating an oligonucleotide, where at least one part of the oligonucleotide is complementary to the closed structure and at least one part of the oligonucleotide is complementary to the open structure. The gene from which the RNA comprising the exon is transcribed, may be selected from: oligonucleotide is complementary to the open structure. The gene from which the RNA comprising the exon is transcribed, may be selected from: correct complementary and open structure (IOMD), a collagen VI alpha 1 cm abermant bundon and/or a calpain 3 gene (CAPNB). The colligonucleotides produced by the method of the invention are useful for: oligonucleotides produced by the method of the invention are useful for: colligonucleotides produced by the method of the invention are useful for: colligonucleotides produced by the method of the invention are useful for: the efficiency with which a splice donor or splice acceptor sequence is used by a splicing machinery. The present RNA sequence represents an antisense oligonucleotide that is targeted to the DMD gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Generating an oligonucleotide for treating diseases, comprises determining from a structure of RNA from an exon, a region that assumes structure hybridized to another part of the RNA and a region that is not

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to generating an oligonuclectide and involves determining from a secondary structure of RNA from an exon, a region that a sassumes a structure that is hybridized to another part of the RNA (closed structure) and a region that is not hybridize in the structure (open structure) and subsequently generating an oligonuclectide, where at least a part of the oligonuclectide is complementary to the consolutions at occuplementary to the open structures are adjacent to each other. The complementary to the open structures are adjacent to each other. The choice oligonuclectide is complementary to a consecutive part of 14-50 nuclectides of the RNA. It also comprises RNA, where the RNA contains a modification, preferably a 2-0-methyl modified ribose (RNA) or consecutive part of 14-50 nuclectide is complementary to a consecutive part of 14-50 nuclectides of the RNA. It also comprises RNA, where the RNA contains a modification. The pre-mRNA generates a coding region for a protein. The percent of the RNA comprising the exon from mRNA per from the pre-mRNA generates a coding region for a protein. The gene (rouchal), a myclubular myopathy 1 gene (MYMA), a dysferilin gene (CDAA), a navicubular myopathy 1 gene (MYMA), a dysferilin gene (EMD), and/or a calpain 3 gene (GAMA). Preferably, the gene is the DMD gene. The oligonucleotide, its equivalent, or the compound is useful for a least in part altering recognition of the exon creament of an inherited disease; for inducing exon skipping in a preman, for altering exon-recognition in a pre-mRNA; for altering exon-recognition in a pre-mRNA; for altering exon-recognition of a medicament for the exon by a splicing machinery; for inducing exon-skipping of two three, or by a splicing machinery; for inducing exon-skipping of two exons in a pre-mRNA, where intervening sequence further comprises exon and a sequence lone intervening sequence intervening exon exons. Sequences ADS73865-ADS73903 represent antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                   Generating an oligonucleotide for treating diseases, comprises determining from a structure of RNA from an exon, a region that assumes structure hybridized to another part of the RNA and a region that is not

The present invention describes an isolated nucleic acid molecule (I), which encodes a polypeptide (II) required for the viability and/or growth and/or reproduction of nematodes (Caenorhabditis elegans), or its fragment. (I) and (II) have nematocide and plant protectant activities, and can be used in gene therapy. (I) is useful for producing (II) required for the viability, growth and/or reproduction of nematodes. Control of the present invention are also useful in a screening assay for interacting drugs that inhibit, stimulate or affect worm growth, the present invention. They are useful for diagnosing or treating human or animal diseases associated with the infection or presence of nematode worms, e.g. Mucharia bacrofti, Brugia malayi, Loa loa or onchocerca volvulus. These diseases include calabar swellings, lymphatic filarisais (elephanticais) or onchocercoma. The nucleic acids, probes, polypeptides, fusion proteins and antibodies are also useful for diagnosing or treating plant diseases associated with the infection or presence of nematode worms. Furthermore, the nucleic acid and amino acid sequences are useful for developing computational models, structural models or other models for evaluating drug binding and efficacy. The present sequence represents a primer which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                   New Caenorhabditis elegans genes required for viability, growth or reproduction of nematodes, useful for diagnosing or treating e.g. onchocercoma or elephantiasis in humans or animals, or plant diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HCV infection; replication; pathogenesis; virucide; vaccine; gene therapy; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a new antisense oligonucleotide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding PCTAIRE protein kinase 2, that specifically hybridises with the nucleic acid encoding PCTAIRE protein kinase 2 and having a sequence comprising 20 bp. The antisense oligonucleotide is useful for preparing a composition for treating e.g., neurological disorders. This sequence represents a human
                                                                                                                                                                                               /mod_base= OTHER

New double-stranded short interfering nucleic acid comprises sugar-
modified pyrimidine bases useful for treating infection with hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     short interfering nucleic acid; siNA; virus replication inhibition; hepatitis C virus; HCV; sugar modification; virucide; antiinflammatory; hepatotropic; cytostatic; RNA interference; HCV infection; liver failure; hepatocellular cancer; cirrhosis; ss.
                                                                                                                              The invention relates to a novel isolated double stranded RNA coligonuclectide about 19 to about 25 ribonuclectides in length or its equivalent. One strand of the oligonuclectide comprises the same nuclectide sequence as a region of a hepatitis C virus (HCV) target RNA polynuclectide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonuclectide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus short interfering nucleic acid sense strand SeqID305.
                                                          New double stranded RNA oligonucleotide, useful for preparing a composition for treating or preventing hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated double stranded RNA oligonucleotide about 19 to about 25 ribonucleotides in length or its equivalent. One strand of the oligonucleotide comprises the same nucleotide sequence as a region of a hepatitis C virus (HCV) target RNA polynucleotide sequence required for hepatitis C virus infection, replication or pathogenesis in vitro or in vivo in a host cell. The oligonucleotide of the invention demonstrates virucide activity and may be useful for preparing a composition or vaccine for treating or preventing hepatitis C virus, as well as during gene therapy procedures. The current sequence is that of the HCV coding region-derived conserved RNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                      New double stranded RNA oligonucleotide, useful for preparing a composition for treating or preventing hepatitis {\tt C} virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADL70462
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                          This invention relates to novel double-stranded short interfering nucleic acids (sINA) that inhibits replication of hepatitis C virus (HCV), where one strand is an antibases strand (ASS) that is complementary to (part of an HCV RNA (portion) and a sense strand (SS) that is complementary to (part and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antiinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The siNA s of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating replication and its consequences (liver failure; hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The sinA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                                                ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 short interfering nucleic acid; siNA; virus replication inhibition; hepatitis C virus; HCV; sugar modification; virucide; antiinflammatory; hepatotropic; cytostatic; RNA interference; HCV infection; liver failure; hepatocellular cancer; cirrhosis; ss.

```
This invention relates to novel double-stranded short interfering nucleic acids (siNA) that inhibits replication of hepatitis C virus (HCV), where consider an antisense strand (ASS) that is complementary to (part of an HCV RNA (portion) and a sense strand (SS) that is complementary to (part of an HCV RNA (portion) and a sense strand (SS) that is complementary to (part and where most of the pyrimidine nucleotides comprise a sugar modification. The invention may allow development of compounds with virucide, antinflammatory, hepatotropic or cytostatic activities by modulation (inhibition) of expression or activity of HCV RNA, by RNA interference. The sinAs of the invention may be used to inhibit replication of HCV, in cells, tissue explants or organisms, for treating HCV infection and its consequences (liver failure, hepatocellular cancer and cirrhosis), and also for drug screening, diagnosis, target identification and validation, genetic engineering, pharmacogenomics, studying gene function and gene mapping (for example of single-nucleotide polymorphisms). The chemical modification improves stability, activity, cellular uptake and/or binding affinity. The sinA can be directed to conserved regions of HCV genes, so are active against many different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
New double-stranded short interfering nucleic acid comprises sugarmodified pyrimidine bases useful for treating infection with hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RNA interference; RNAi; short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective; nootropic; gene silencing; DNA-RNA hybrid;

The present sequence is the sense strand of a short interfering RNA (sirNA) targeted to human clusterin. The antisense strand is also provided ADL70463. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing streaments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.
                                     New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RNA interference; RNAi; short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective; nootropic; gene silencing; DNA-RNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Jansen B, Gleave ME, Signaevsky M, Beraldi E, Trougakos IP;

                   New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's
                                                                                                               The present sequence is the antisense strand of a short interfering RNA ADL70462. The sirNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TREM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as treatment of prostate cancer, sarcomas such as cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                           .

clusterin in the melanoma cells.

```
ö
                                                                                           The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin. The siRNAB molecules direct cleavage of clusterin mRNA. A method for regulating expression of bcl-xL in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl-xL is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl-xL is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of
         Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of clusterin in the melanoma cells.
                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                         The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70425 targeted to clusterin. The siRNAs molecules direct cleavage of clusterin mRNA. A method for regulating expression of bcl-xL in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl-xL is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl-xL is known to act as an inhibitor of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of clusterin in the melanoma cells.

The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL/0403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL/0404-ADL/0421 or short interfering RNA (siRNA) ADL/0422-ADL/0445 targeted to clusterin. The siRNAB molecules direct cleavage of clusterin mRNA. A method for regulating expression of bol-xL in a subject or cell into comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bol-xL is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bol-xL is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of apoptosis.

v oligo:nucleotide specific for apolipoprotein-J polymorphisms - v identify patients susceptible to Alzheimer's disease or prostate cancer. New

Example 1; Page 21; 62pp; English.

AAT41542 and AAT41543 are J1 allele-specific primer/probes used as controls in an example of a method for detecting polymorphisms associated with an allelic variation in the human apolipoprotechard (Appu) gene. The oligonucleotide (OG) detects the probability of a person developing Alzheimer's disease (AD), preferably in patients of African or Hispanic descent. The OG also detects the probability of a person developing a cognitive disorder, or a prostatic carcinoma. Transgenic mammals expressing an allelic variant of an ApoJ gene may be used as a prognostic and diagnostic means for studying AD, and to determine the effectiveness of therapeutic drugs

```

```
The present invention describes a novel enzymatic nucleic acid (ENA)
having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
(i) (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
(ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
(can inhibit collagenase and stromelysin production in the synovial
can inhibit collagenase and stromelysin production in the synovial
con inhibit collagenase and stromelysin production in the synovial
con inhibit collagenase and stromelysin production in the synovial
conservationary osteoarthritis or rheumatoid arthritis. The ENA's can also
be used to treat antigen presenting cells of a donor to induce tolerance
in a recipient to an alloantigen of a donor. They can also be used for
conhancing graft tolerance or for treating autoimmune disease, and for
treating allergies and other inflammatory conditions. The ENA's can also
be used in diagnosis. Ribozyme therapy impacts on the expression of
stromelysin which accompany treatment with retinoids and dexamethasone.

The concentration of ribozyme required to affect a therapeutic treatment
is lower than that required of antisense molecules, and is highly
specific. The present sequence is used in the exemplification of the
                                                        Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; hairpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment auto-immune diseases.
                                               Rabbit stromelysin hammerhead target SEQ ID NO:535.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1; Page 154; 307pp; English.

The invention relates to a nucleic acid molecule which down regulates corression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids a ribozyme or a rubczyme (an endolytic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) proceed an amberzyme (cleaving RNA with an NYM motif) proceed an endolytic nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a PGY motif). The CD20-targetting nucleic acid is used to cleave RNA coff configuration in may further comprise the use of one or more configuration in particular, the CD20 targetting nucleic acid may be used to therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-treat lymphoma (MLL), immunocytoma (MCL), immunocytoma in the Lagrace of the NOGO gene in the
                                                                                                              Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 88; Page 68; 200pp; English.

presence of a divalent cation that is preferably Mg^2,+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (MS), darkingon's disease, creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to nucleic acids can be used as probes to detect, characterise and quantify compared initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption indisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines for for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines of for replacement therapy. The production, and in vaccines of for replacement therapy. The present associated with the expression of hGDMLP-1 is particular heart of sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed production in the exemplification, but was obtained in electronic format directly from WIPO at the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; immunostimulant; gene therapy; vaccine; human;

The present invention relates to novel human zinc finger-containing proteins and their coding sequences; MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is encoded at chromosome 6p21.3-2.2, MDZ7 is encoded at chromosome 6p21.3-2.2, MDZ7 is encoded at chromosome 6p21.3-2.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ1, e.g. cancer or developmental disorders. The nucleic associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and sloo be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as the present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; se.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and enzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV. The compounds and compounds of the invention are useful for the treatment of degenerative and classase states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV compounds or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                       Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptenmer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, amberzymes, amberzymes, antisense concernity and are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV CO DNA. The nucleic acids may be used to modulate the expression of HBV CO Compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 18% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, cleenifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and comparing the polypeptides are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cill degeneration (e.g. Alzhaimer's disease or solizophrenia).

Calso he used to screen for their specific interactive molecules, and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can and/or prognosis of these theorem for their specific interactive molecules.
                                                                                                    New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                        ö
                                             Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                      The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                         Human; 88; probe; myosin-like protein-1; hGDMLP-1;

```
The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hgDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids fully (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or pharmaceutical composition of the inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; growth factor; zapol; angiopoietin homologue; cell growth; tissue development; multimeric protein; hematopoietic; angiogenic; tissue revascularization; full-thickness skin wound; venous stasis ulcer; fracture repair; skin grafting; reconstructive surgery; transplanted cell; PCR primer; ss.
                                                                                                                                                                                                                                          Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Zapol, a novel angiopoietin homologue, and related DNA, useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR primer for DNA encoding a human growth factor designated zapol.

comprising at least 8 contiguous nucleotides where one of the nucleotides is an SNP as cited above, or their complement), an isolated comprising an amino acid sequence selected from any of the 696 amino acid sequences (not defined in the specification), an antibody cthat specifically binds to the polympetide (or its antigen-binding the SNP as cited (where fragment), an amplified polymucleotide containing the SNP as cited (where cf fragment), an amplified polymucleotide containing the SNP, as the for nucleotides in length), an isolated polymucleotide which specifically containing the SNP, as that for hybridises to a nucleic acid molecule containing the SNP, as that for cefetering a SNP in a nucleic acid detecting a SNP in a nucleic acid molecule, detecting a type prophylactically treating stenois: The detection in therapeutically or prophylactically treating stenois: The detection in therapeutically or prophylactically treating stenois: The detection step of the method is carried out by a process selected from allelescapedic amplification, sequencing, 5' nuclease digestion, molecular specific amplification, sequencing, 5' nuclease digestion, molecular conformation polymorphism. The method is useful for identifying an individual who has altered risk for develophym coronary stenoisis, and ultimately sudden cardiac death. The present sequence is an allele conformation pulymorphism in the present sequence is an allele conformation but are provided on a CD-R named CL001510CDR which was not specification but are provided on a CD-R named CL001510CDR which was not conspiled with the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /nore= "This sequence contains a polyamide backbone instead of a deoxyribose backbone"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                      PCR primers AAX85603-04 were used to amplify DNA encoding a human growth CC factor designated zapol. Zapol is an angiopoietin homologue. The polypeptide is used to stimulate cell growth and tissue development. The polypeptides form multimeric proteins. Zapol has angiogenic or communitations to be used in assays for angiogenic activity. Zapol proteins can be used in assays for angiogenic activity. Zapol proteins may be used therapeutically to stimulate activity. Zapol proteins may be used therapeutically to stimulate construction of tissue. Specific applications include treatment of full-thickness skin wounds, including venous stasis ulcers and other chronic, non-healing wounds, including venous stasis ulcers and other constructive surgery, and establishment of vascular networks in transplanted cells and tissues. Zapol is also useful as a research agent, such as in the expansion of hematopoietic cells (including stem cells) and endothelial cells. The polypeptides are added to tissue culture media con the contract of the cells of the contract of the contract of the contract of the contract of the cells in the contract of the contract 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to identifying an individual who has altered risk for developing coronary stenosis comprising detecting a single nucleotide polymorphism (SNP) in any one of the 67073 nucleotide sequences (not aptwen in the specification), in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for stenosis in the individual. Also included are an isolated nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying an individual who has altered risk for developing stenosis comprises detecting single nucleotide polymorphism (SNP), in the individual's nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 88; PCR; primer; Allele specific primer; coronary stenosis; angina; ischaemic chest pain; myocardial infarction; sudden cardiac death; SNP; single nucleotide polymorphism.
                                     study and regulation of angiogenesis and for developing inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Allele specific primer A for human stenosis marker hCV25612495.

Peptide nucleic acid probes for detection of ribosomal nucleic acid of mycobacteria - allow differentiation between species of tuberculosis complex and others and can penetrate cell membranes without pretreatment.
                                                                                                   This is the nucleotide sequence of the peptide nucleic acid (PNA) probe used in the method of the invention, to detect ribosomal nucleic acid of mycobacteria. The probes are used, in situ or in vitro, for detection of the Mycobacterium tuberculosis complex (MTC), specifically M. tuberculosis, and especially in sputum samples, but also in other body fluids, bioppy specimens, foods, soil, air and water. Particularly, they are used to diagnose, stage or monitor infection, or for identification of drug-resistant strains (which generally have mutations in rRNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; harmeribad ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, and enzymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and g-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV or DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and or necession and or necessarion and second and or necessarion and gene expression and as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections,
                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention relates to a method for identifying a subject at risk of breast cancer. The method comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The nucleic acid sample comprises the Didi region (ADO79402), KIAA0783 region (ADO79403), DPF3 region (ADO79404) or CENPCI region (ADO79405). The gene DiGI (discs, large homolog I (Drosophila)) is also known as synapse-associated protein 97, hdlg or SAP97. Didi has been mapped to chromosomal position 3429. The gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783 has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAA0783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a
                                                                                                                      The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cytostatic; Gene therapy; breast cancer; human; DLG1; KIAA0783; DPF3; CENPC1; SNP; single nuclectide polymorphism; PHF14; PHD finger protein 14; chromosome 7p21.3; zinc finger protein; transcription factor; extend; primer; ss.

novel gene with unknown function, however, being a zinc finger protein, it likely to be a transcription factor. The gene DPF3 (D4, zinc and double PhD fingers, family 3) is also known as CERD4, ce-d4, FLJ14079 and 2810403B03Rik. DFP3 is a Rho family guanine-nucleotide exchange factor. DPF3 has been mapped to chromosomal position 14g24.3-g31.1. The gene CENPCI (centromere protein (1) is also known as Centromere autoantience protein (21) is also known as Centromere d13.3. CENPCI is a centromere autoantien and a component of the inner kinetochore plate. The CENPCI protein is required for maintaining proper kinetochore size and a timely transition to anaphase. The method is useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, to analyze and predict a response to a breast cancer treatment, and in clinical drug predict a response to a breast cancer treatment, and in clinical drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ35720-23 were used to generate an expression cassette for the insertion of the equine influenza virus (EIV) hemagglutinin (HA) (A1/Prague/56) into NYVAC and ALVAC recombinant vectors. The HA gene sequence was isolated from an EIV cDNA library and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cox WI;

was amplified by polymerase chain reaction. The amplified sequence was disserted into the linearised plasmid pRW764.2. The resultant plasmid was designated pcCV1 and contains the vaccinia virus H6 promoter followed by a polylinker region and flanked by canarypox virus homologous sequences. ALVAC is derived from a Copenhagen vaccine strain of vaccinia virus and ALVAC is derived from a canarypox virus which has been modified by deletion of non-essential regions of the genome encoding known or potential virulence factors. The deletion lot of both vectors were engineered as recipient loci for the insertion of forcing genes. See also AAQ35501-864. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ribozymes targetted to interleukin 2 - useful for treating e.g. cancer, autoimmune disease and allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; IL-2 receptor g-chain; interleukin 2 receptor gamma chain; hammerhead ribozyme; hairpin ribozyme; substrate; expression; cancer; autocimmune disease; psoriasis; allergy; inflammatory disease;

SNP specific upper PCR primer SEQ ID 301

14-AUG-2001 (first entry)

AAH37505;

AAH37505 standard; DNA; 18 BP

```
Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide correct of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP final final for genotyping a mucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait is uspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic, traits include diseases e.g. to dystrophy, familial hypercholesterolaemia, polycystic kidney disease, categonesis inmerfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial diseases, including, theumatoid arthritis, multiple solerosis, crifiammation, cancer, nervous system diseases and infection by pathogenic mitty analysis. The present sequence represents a PCR primer specific for a human sub containing manalysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94675 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment off, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce tolerance in a recipient to alloantigen from a donor

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

The present invention describes a pharmaceutical composition comprising a nucleic acid (I) protein tyrosine phosphatase PTP10D, non-receptor concleic acid (I) protein tyrosine phosphatase PTP10D, non-receptor protein tyrosine kinase Tec, egg derived tyrosine phosphatase (EDTP) gene (Emily or encoded polypeptide, fragment or variant of nucleic acid molecule of PTP10D, Tec, or EDTP gene family or encoded composition can have antidiabetic, hypotensive, cardiant, antilipaemic, can be used in gene therapy. The composition is useful for the manufacture of an agent for detecting and/or verifying, for treating and can be used in agent for detecting and/or verifying, for treating and alloridates and seating disorder, including metabolic diseases cut as abesity and other body weight regulation disorders, as well as the astendiance and and sorder, including metabolic diseases companies, or coronary heart disease, hypercholastroclaemia, coronary heart disease, hypercholastroclaemia, coronary heart disease, hypercholastroclaemia, coronary heart disease, hyperclaemia, cancers of the reproductive organ), sleep apnea, and other diseases, in cells, cell reproductive organ), sleep apnea, and other diseases, in cells, cell reproductive organ), sleep apnea, and other diseases, in cells, cell also be used in controlling the function of a gene and/or gene product which is influenced and/or modified by a PTP10D, Tec, or EDTP homologous polypeptide, and for identifying substances capable of interacting with a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New compositions comprising tyrosine phosphatase PTP10D, protein tyrosine kinase Tec or egg-derived tyrosine phosphatase genes or proteins, useful for treating or preventing metabolic diseases, e.g. as obesity or cachexia.

```

```
The present invention relates to silicon-coated magnetic particles in which the silicon content is less than 20 wt. % of total. These can be used to isolate nucleic acids from body samples, especially serum, particularly for diagnostic detection of RNA from hepatitis C virus or HIV. The present sequence is a probe used to isolate RNA from hepatitis C virus virus from serum in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Silicon-coated magnetic particles, useful for purification of nucleic acid from body samples, do not need to be separated before quantification
                                                                                                                                                           ö

                                                        precursor
The nucleic acid molecule
PTP10D, Tec or EDTP homologous polypeptide. The nucleic acid molecule PTP10D, Tec, or EDTP family or their fragments, may be used in the preparation of a non-human animal which over- or under-expresses the PTP10D, Tec, or EDTP gene product. The present sequence represents a primer for mouse protein tyrosine phosphatase receptor type B precurs (PTPRB), which is used in an example from the present invention
                                                                                                                                                           Gaps

(RIBO-) RIBOZYME PHARM INC.

ŏ Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment auto-immune diseases.

Example 1; Page 154; 307pp; English.

The present invention describes a novel enzymatic nucleic acid (ENA) having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues ; (ii) a 2-C-allyl modification at position 4 of the ENA; (iii) at least ten 2'-O-methyl modification; and (iv) a 3'-end modification. The ENA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the treatment or prevention of arthritis, oparticularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantigen of a donor. They can also be used for treating allergies and other inflammatory conditions. The ENA's can also be used in diagnosis. Ribozyme therapy impacts on the expression of a tromelysin without introducing the non-specific effects upon gene expression which accompany treatment with retinoids and dexamethasons. The concentration of ribozyme required to affect a therapeutic treatment

Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restences, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons. Claim 177; Page 168; 259pp; English.

WPI; 1999-009494/01.

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases

caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and mutations in diseased cells and to determine c-raf RNA. Specifically NACS with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of -raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. ANY00922 to ANY03877 represent NACS that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NAGOD). The nucleic acids (e.g. a ribozyme or a nucleic acids (e.g. a ribozyme or a nucleic acids and been enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids and norm motify motif), a d-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a d-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a d-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif), a d-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motif) a d-cleaver (cleaving RNA with a NYM motif) proposessing an NCH motific acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA coff contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level coff CD20. The treatment may further comprise the use of one or more coff contact of NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiancy virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma ö Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss. Gaps Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:8352. ; 0 Query Match

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be consed as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production associated with the expression of hGDMLP-1, in particular heart and skeleral muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed the succession of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                     New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; SEQ ID NO 8352; 214pp; English

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific ally recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The production and invaccines or for replacement therapy. The production and invaccines encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed production, but was obtained in electronic format directly from MIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

```

The present invention describes a human genome-derived myosin-like concein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 con be used in gene therapy and vaccine production. The hGDMLP-1 concleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 conclein variants having desired phenotypic improvements, and for concentration to raise artibodies that specifically recognise hGDMLP concerns as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule concentration, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration is selected associated with the expression of hGDMLP-1 may be used for diagnosing a polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a concentration of the present sequence represents an oligomer used in the screening of the modell sequence in the expression of hGDMLP-1 in particular heart concentration, the esquence data for this patent did not form part of the printed captured as obtained in electronic format directly from WIPO specification, but was obtained in electronic format directly from WIPO captured. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

ö
and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disporder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed The sequence data for this patent did not form part of the printed The sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymuclectide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 cacide cacide can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to provein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description infisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines of for replacement therapy. The disorder associated with the expression of hGDMLP-1, in paticular heart disorders associated with the expression of hGDMLP-1, in paticular heart can be seen to be a sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
                               The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encopalitis, mycarditis, meningitis, neurologic infection, hepaticis, encephalitis, mycarditis, meningitis, neurologic infection, hepaticis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-Cleaver, DNAxyme, haberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least then 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a least three of the 5' terminal nuclectides and a 3' end modification of a last three specification of the present sequence is that of a nucleic acid

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis; liver failure, hepatocaliular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothioate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEO ID NO 1 to 37080 are claimed; however, SEO ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatis, worderdis, myocardis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-O-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclecides and a 3' end modification of a least three of the 5' terminal nuclecides and a 3' end modification of a last three soften molecty. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic caids of the invention are useful as probes and primers for detecting, dentifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, concornent of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the nucleic and and/or treatment of viral corporation, specifically cancer but also Alzheimer's disease and diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell cates are useful for disponents and/or prognosis of these chizophrenia. Analysis of the expression of the 17 mer nucleic acids in gene chips. The polypeptides are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression crelated human fukutin oligonucleotide of the invention

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is concoded at chromosome 6p12.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p12.2 and MDZ12 is encoded at chromosome 16p2.1. The MDZ3, MDZ4, MDZ7, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, encoded or increased expression of diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids an also be used as probes to detect and characterize gross atterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as two probes are useful as therapeutic agents for gene therapy or as a vaccines. The present sequence was used to illustrate the invention.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immundeficiatory virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ65531, ABZ65531, ABZ66524, ABZ65530 - ABZ65585 represent substrate/target sequences for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-daavar ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;
                                                                                                                                                                              Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.9%; Score 14.4; DB 1; Length 17; 93.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is proteins and their coding sequences: MDZ3, MDZ4, MDZ7. MDZ12. MDZ3. Encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p2. MDZ4, MDZ4, MDZ4, MDZ4, MDZ4, MDZ4, MDZ4, MDZ3, and MDZ12 sequences are useful in therapy, or manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ12. The nucleic acids can also be useful for diagnosing or monitoring a disease caused by altered as probes to detect and characterize gross are also mDZ3, MDZ4, MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as contines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                           New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymes, amberzymes, auch as hammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV COMPOUNDS and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies disclosed is a method for screening compounds and/or potential therapies disclosed is a method for screening compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV infection or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                  Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection.
                                                                                                                                                                   Lee P;

The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
are nucleic acids such as hammerhead ribozymes, DNAzymes,
and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes,
inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
c are nucleic acids decoy molecules and aptemers that bind to HBV reverse
c transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
CDNA. The nucleic acids may be used to modulate the expression of HBV
COMPOUNDS and MGV potential therapies directed against HBV, and compounds
compounds and/or potential therapies directed against HBV, and compounds
compounds and/or potential therapies directed against HBV, and compounds
compounds and/or potential therapies directed against HBV, and compounds
c methods of the invention are useful for the treatment of degenerative and
c disease states related to HBV and HCV infection, replication and gene
c expression such as cirrhosis, liver failure, and hepatocallular
c arcinoma. The present sequence represents a substrate for one of the HBV
c inboxyme, inozyme, zinozyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro identifying, quantifying and/or amplifying nucleic acids, as in vitro identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (A) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides and polypeptides can and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotides differentially regulated in response to cholesterol and adipogenesis are useful to detect and treat associated conditions such as obesity, athersclerosis, diabetes mellitus and coronary artery heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a composition comprising at least one expression vector comprising a polynucleotide of the invention. The composition has anorectic, antiarteriosclerotic, cardiant and antidiabetic properties. The invention is used to detect and treat conditions associated with elevated cholesterol and lipid or during adipogenesis, particularly obesity, athersclerosis, diabetes mellitus or coronary artery heart disease. This sequence represents a polynucleotide differentially expressed during cholesterol homeostasis and adipogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human Phe311Leu mutant Abl kinase, allele specific PCR primer F311T.

The present invention relates to mutated human Abl kinase domains that are functional and resistant to inhibition of their tyrosine kinase activity by N-(4-methyl-3-(4-pyridin-3-yl-pyrimidin-2-ylamino) -phenyl)-4-(4-methyl-piperazin-1-ylmethyl)-benzamide, or its salt. The mutant Abl polypeptides are useful in screening for compounds that inhibit the tyrosine kinase activity of such polypeptides. Polymucleotide sequences encoding the mutant polypeptides are useful for the production of the mutant polypeptides are useful for the production of the mutant polypeptides are useful for the production of the diagnosis of leukaemias. The mutant polypeptides are also useful in the diagnosis of the present invention
                                                                                                                                                                        New isolated polypeptide having mutated native human Abl kinase domains, useful for screening compounds that inhibit tyrosine kinase activity and for diagnosing leukemias.
                                                                                Hochhaus A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human Phe311Leu mutant Abl kinase, allele specific PCR primer F311C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                 The present invention relates to mutated human Abl kinase domains that are functional and resistant to inhibition of their tyrosine kinase activity by N-(4-methyl-3-(4-pyridin-3-y-pyrimidin-2-y-phanino) -phenyl)-4-(4-methyl-piperazin-1-ylmethyl)-benzamide, or its salt. The mutant Abl polypeptides are useful in screening for compounds that inhibit the tyrosine kinase activity of such polypeptides. Polymuclectide sequences encoding the mutant polypeptides are useful for the production of the mutant polypeptides are useful for the production of the diagnosis of leukaemias. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New device comprising a filter layer comprising a dry solid medium comprising a hydrophilic solid matrix, and an isolation layer, useful for storing and analyzing a nucleic acid containing moiety.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA storage, DNA analysis, virus identification; bacteria identification; reverse transcriptase; RT-PCR; primer; 88; HP6.
                                                                                                      New isolated polypeptide having mutated native human Abl kinase domains, useful for screening compounds that inhibit tyrosine kinase activity and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
```

The invention relates to a device for storage and analysis of a nucleic acid containing a moiety in a biological sample, comprising a filter layer comprising a dry solid medium comprising a hydrophilic solid

Example 1; SEQ ID NO 4; 14pp; English

```
matrix, and an isolation layer comprising a dry solid medium comprising a neutral solid matrix attached to a composition comprising a detergent. Storing and analysing a nucleic acid containing a motety in a biological sample comprises applying a biological sample to the filter layer. It is the components of the biological sample through the filter layer layer to the isolation layer, retaining the nucleic acid components in the isolation layer while removing the nornucleic acid components in the isolation layer, providing a primer and analysing the nucleic acid components using at least one primer. The device and method are useful for storing and analysing a nucleic acid containing a moiety in a biological sample. They are also useful for identifying known or unknown virions or bacteria contained in a fluid. This sequence represents a reverse transcriptase PCR (RT-PCR) primer used in the scope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       virus and comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specifically cleaving RNA derived from hepatitis B virus and comprisin
one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNAzymes and inozymes

specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, thepaticis, combination with other therapies and liver failure, either alone or in combination with other therapies such as lamivadine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of a cell, for the study of RNA and for down-regulating gene expression of sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this parent is also available in electronic format from USPFO at sequence.used.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                              Human; ss; probe; myosin-like protein-l; hGDMLP-l;
hGDMLP-l agonist hGDMLP antagonist; hGDMLP inhibitor; heart disorder;
skeletal muscle function.
                                                                      Human GDMLP-1 probe SEQ ID NO:8665.
                                                                                                                                                                                                                                                                                                                                            30-JAN-2001; 2001WO-US000661.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of preventing a disorder associated with decreased expression or activity of The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle

Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                 invention relates to a novel polypeptide (I) comprising a sequence of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully

defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and acks identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hoDMLP-1, or as an inhibitor of hoDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel myosin-like protein-1, useful for treating or preventing disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; 88; probe; myosin-like protein-1; hGDMLP-1;

                                                                            The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of 651, 95% deviation from (S1) which are conservative substitutions, and antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A preventing a disorder associated with decreased expression or activity of preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; 88; probe; myosin-like protein-1; hGDMLP-1;

                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                              The invention relates to a novel polypeptide (I) comprising a sequence (S1) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (S1), 95% deviation from (S1) which are conservative substitutions, and 65% identity to (S1). A polypeptide of the invention acts as a agonist or antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the
                                                                       Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle

The invention relates to a novel polypeptide (I) comprising a sequence (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully defined in the specification, a fragment of at least 8 amino acids of (SI), 958 deviation from (SI) which are conservative substitutions, and 658 identity to (SI). A polypeptide of the invention acts as a agonist antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A pharmaceutical composition of the invention is useful for treating or preventing a disorder associated with decreased expression or activity of hGDMLP-1, such as a disorder of heart and/or skeletal muscle function. The present sequence represents a 17-mer nucleotide, used in the invention for scanning the sequence represented in ACN63103
                                                                                                                                                                                                                                                                                     Novel myosin-like protein-1, useful for treating or preventing disorder associated with decreased expression or activity of human genome-derived myosin-like protein-1 such as disorder of heart and/or skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

10828394-1_1-1643.rng.sl

Sequencing complex genomes, present as fragments in a cosmid library - b sequencing end specific nucleotides of each clone then correlating with spatial relationship of cosmid, esp. for mammalian chromosomes. Example 3; Page 44; 128pp; English WPI; 1995-036508/05

In a sequence-sample mapping procedure using a Giardia lamblia 20-genome equivalent cosmid library, each end of the genomic insert in a cosmid was detected as a vector/genomic chimera by hybridisation with probes flanking the T3 and T7 promoter sites of 8Cos-1. The 1046 bp T3 probe was amplified from 8Cos-1 with the primers AAQ80946 and AAQ80947 and the 1004 bp T7 probe was amplified with primers AAQ80948 and AAQ80949. The T7 probe was labelled with 35S- dATP and the T3 probe with 33P-dATP for dual label hybridisations. Maps were constructed by determining an order of fragments with no gaps using a computer program. (Updated on 25-MAR-2003 to correct PN field.)

New polynucleotides and polypeptides are useful in gene therapy, developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy.

Example 8; SEQ ID NO 5102; 305pp; English.

The invention relates to a novel human polynucleotide and the encoded polypeptide. A polynucleotide of the invention may have a use in gene therapy. An oligonucleotide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynucleotide or as a probe for detecting the polynucleotide. The polynucleotides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines

for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynucleotides are useful as pharmaceutical agents. The present sequence represents an oligonucleotide used in the invention.

New isolated polynucleotides comprising single nucleotide polymorphisms of the cardiovascular gene, useful for assessing predisposition or susceptibility to a cardiovascular disease, e.g. atherosclerosis, restenosis or stroke.

Disclosure; Page 78; 187pp; English.

The invention relates an isolated polynucleotide (I) encoded by a cardiovascular associated (CA) gene, having allelic variation contained in a functional surrounding like full length cDNA for CA gene promoter sequence. (I) is a polynucleotide comprising single nucleotide polymorphisms predicting cardiovascular disease. The polynucleotide polymorphisms predicting cardiovascular disease. The polynucleotides are useful for assessing cardiovascular disease. (E.C. atherosocial contains a cardiovascular disease, e.g. catherosocial contains a cardiovascular disease, e.g. catherosocial contains and stroke. These may also be used inflammation, myocardial infarction, and stroke. These may also be used to predict personal medication schemes omitting adverse drug reactions, crasp probes for detecting genetic polymorphisms and as templates for the recombinant production of normal or variant peptides/polypeptides encoded by the genes of the invention.

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers pecifically priming and allowing amplification of each Vbeta gene, vbetaRNA or cDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases including autoimmune diseases, degenerative nervous system diseases, and including autoimmune diseases, degenerative nervous system diseases, and neoplastic disease. Autoimmune diseases include Addison's disease, and neoplastic diseases. Autoimmune diseases include Addison's disease, arrophic gastritis. Degenerative nervous system diseases include multiple sclenosis and Alzheimer's disease. Hypersensitivity diseases include multiple sclenosis and Alzheimer's disease. Hypersensitivities such as those present in Coodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Nycobacterium. Neoplastic diseases include lymphoproliferative diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           οĘ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonuclectides of the present invention (see AAF45151 and AAF45153-
F45161). The method is useful for ameliorating the effects of psoriasis,
fichthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keatcosis,
neoplasias, scleroderma, warts, benign growths, cancers of the skin,
hyperneovascular condition such as a neovascular condition of the retina,
barin or skin, growth factor-mediated malignancies, other sclerotic
disease, kidney disease, hyperpoliferation of the inside of blood
vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense
such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta point mutation PCR
                                                                                                                                                             Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGP binding protein [IGFB]-2 or IGFB3), which is capable of inhibiting or reducing prootth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood

The invention relates to an oligomuclectide for targeted alteration of a genetic sequence, which comprises a single-stranded oligomuclectide comparing a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chamical modifications of the oligomuclectide. The chemical modifications of chamical modification, an LNA modification, two or more consist of o-methyl modification, an LNA modification, two or more consist of come linkages on a terminus, or a combination of any two or more of these modifications. The oligomuclectides are useful for directing repair or alteration of plant genetic information. The coligomuclectides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved contritional value (e.g. altering amino acid content of plants or conferring amino acid over production), herbicide resistance (e.g. conferring amino acid over production), herbicide resistance (e.g. altering amino acid over production, modified starch production disease resistance, modified oil production, modified starch production (e.g. increased starch or production of waxy starch), altered floral
                                                                                                                                                                                                                                                                                                   Chromosomal genomic alteration; genome altering oligonucleotide; PCR; se; o-methyl modification; LNA modification; phosphorothioate linkage; bubx repair; DNA alteration; environmental tolerance; hygromycin: B; abiotic stress tolerance; improved nutritional value; hygromycin: B; amino acid over production; herbicide resistance; gulphonylurea herbicide resistance; porphyric herbicide resistance; sulphonylurea herbicide resistance; modified oil production; modified starch production; waxy starch; modified floral morphology; male-sterile plant; albino mutant; modified fatty acid content; reduced palmitate production; albino plant; photosynthetic process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil production.
                                                                                                                                                                                                                                                                Stress tolerance conferring genome altering oligonucleotide #63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kim J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 7; Page 100; 220pp; English
